SUMMARY

Rails backend engineer who treats data changes as production-risk work: schema design, backward-compatible service contracts, and tests that catch problems before users feel them. 2+ years shipping Ruby on Rails APIs on fintech data, plus a personal multi-service platform where tickets, orders, and payments each own their store and must stay consistent through create / cancel / expire. Comfortable in a remote, async, write-it-down team and ready to deepen PostgreSQL migration and upgrade-safety work.

SKILLS MATCHED TO THIS ROLE

Must-align: Ruby on Rails, backend feature design/review, schema/data modeling, migration-safety mindset, automated tests, written/async communication

Data: Document and relational modeling, indexes, query behavior, backward-compatible API contracts; growing PostgreSQL migration depth

Also: Docker, Kubernetes, CI/CD, Git, production debugging, AI coding tools with review, docs for other engineers

EXPERIENCE

Software Engineer — SkyAch Software Solutions Pvt. Ltd.

Rails backends for exchange / fintech products

Jun 2024 – Aug 2026

- Designed and shipped Rails backend features that touched persistent trading/user data — APIs, validations, and data model changes reviewed before they hit 1,000+ daily users.
- Reasoned about compatibility: older clients and in-flight orders still had to work after an API or schema change.
- Partnered with teammates on reviews so risky data paths (funds, orders, wallets) were checked for safety, not only happy-path behavior.
- Documented API behavior and rollout notes so others could operate the same systems.

SELECTED WORK (PERSONAL)

Multi-service marketplace data layer — MongoDB, events, payments

- Gave each service its own store (users, tickets, orders, payments) and used events instead of shared writes — a practical stand-in for “don’t couple upgrades to a messy monolith dump.”
- Modeled order lifecycle so expiration and cancellation could not double-charge or leave inventory stuck; covered the critical paths with Jest before deploy.
- Ran the stack on Kubernetes so schema/code deploys were repeatable, not one-off laptop state.

EDUCATION

B.Tech, Computer Science and Engineering (AI specialization)

ITM SLS Baroda University, Vadodara

2020 – 2024
