

Atul Banyal

Backend Engineer | Ruby on Rails · REST APIs · Production operations · AI-assisted development

Vadodara, Gujarat · Relocating to Bengaluru · Comfortable with remote / async work

atulbanyalreal@gmail.com · linkedin.com/in/atul-banyal-6629a2185

SUMMARY

Backend-leaning software engineer with 2+ years shipping production Ruby on Rails services, REST APIs, and background workflows used by 1,000+ daily users. Takes features from a loosely defined problem through implement, test, deploy, and production follow-up. Uses Cursor and other AI coding tools daily, then reviews generated code for correctness, security, and maintainability. Strong written communication; used to Git-based reviews in a distributed team.

SKILLS MATCHED TO THIS ROLE

Backend: Ruby, Ruby on Rails, REST APIs, background/async jobs, JWT auth, Node.js/Express (secondary)

Data: Relational modeling, MongoDB, query/index awareness, schema design across services

Production: Automated tests (Jest), Docker, Kubernetes, CI/CD, AWS, Linux, Git, debugging runtime failures

Practices: Code review, secure API design, AI-assisted development with human validation, async written updates

EXPERIENCE

Software Engineer — SkyAch Software Solutions Pvt. Ltd.

Production Rails / fintech platforms

Jun 2024 – Aug 2026

- Owned backend features end to end in Ruby on Rails: clarified requirements, designed APIs, implemented, tested, shipped, and watched them in production for 1,000+ daily active users.
- Built REST APIs, background workflows, and trading/blockchain integrations with attention to correctness, auth, and failure modes — the same “operate what you build” loop: ship, then follow up in production.
- Worked with data models, indexes, and query behavior so money-movement paths stayed fast enough under real traffic; reviewed teammates’ diffs for correctness and operational risk.
- Ran CI/CD on Docker/Kubernetes/AWS; investigated build, deploy, and runtime failures at the feature boundary rather than handing off after merge.
- Used AI coding assistants as a daily multiplier: draft → review → correct for security and maintainability before anything reached main.

SELECTED WORK (PERSONAL — PRODUCTION-STYLE BACKEND)

Event-driven order platform — TypeScript, REST, background jobs, Kubernetes

- Designed bounded services (auth, catalog, orders, payments, expiration) with APIs, data models, and an event bus so order state stayed consistent after create/cancel/expire — similar to shipping a feature through shared backend services.
- Implemented the expiration path as a background job that closes unpaid orders; added Jest coverage and followed failures from test to local deploy.

EDUCATION

B.Tech, Computer Science and Engineering (AI specialization)

ITM SLS Baroda University, Vadodara

2020 – 2024
